Understanding PRF Treatments

What is PRF?

Platelet-Rich Fibrin (PRF) is created from a small sample of your own blood. It contains platelets, fibrin, white blood cells and growth factors that stimulate collagen, improve healing and rejuvenate tissue naturally. Because no anticoagulants are used, PRF releases growth factors gradually over time.

Injectable PRF	PRF Microchanneling
Injected beneath the skin	Applied during microneedling/microchanneling
Best for under-eyes, facial rejuvenation and hair restoration	Best for acne scars, pores, texture, fine lines, pigmentation and overall skin quality
Stimulates collagen below the skin	Stimulates collagen throughout the skin surface
Targets volume loss and tissue quality	Targets skin texture and radiance
Little downtime	24–72 hours of redness is common

Why choose PRF?

PRF uses your body's own regenerative cells to stimulate collagen and elastin, improve skin quality, support healthier hair follicles, soften fine lines, and create natural-looking rejuvenation without synthetic fillers.
