YOUR CONSULTATION

Which PRF path fits your face?

We assess your goals, anatomy, health history and timeline, then recommend injectable PRF, PRF EZ Gel, topical PRF with needling, or another option if it better fits your concern.

WHAT TO EXPECT

- Small same-day blood draw and individualized preparation
- Numbing may be used, depending on the treatment
- Temporary redness, swelling, tenderness or bruising
- Visible change develops progressively; timing varies
- A short series may be recommended for some goals

TELL YOUR PROVIDER ABOUT

blood thinners, platelet or bleeding conditions, active infection, pregnancy or breastfeeding, and keloid history for needling.

*Walk-ins welcome;
appointments recommended.*

525 E Olympia Ave, Unit 9 | Punta Gorda, FL 33950
info@houseofrosefl.com | houseofrosefl.com/services/prf/

Medical Director: Joshua Shaw, MD | FL Lic. ME136232

Not every client is a candidate. Injectable PRF and PRF EZ Gel are RN-performed under medical direction; topical PRF is surface-applied during a selected needling service. Final treatment and timing are confirmed after assessment. Individual outcomes vary.

WHY PRF IS DIFFERENT

A fibrin scaffold. A slower signal.

Both PRP and PRF are made from your own blood. PRF is prepared without an added anticoagulant, allowing a natural fibrin matrix to form around platelets and signaling proteins.

PREPARATION

PRP

Usually includes an anticoagulant.

PRF

Prepared without an added anticoagulant.

STRUCTURE

PRP

Primarily a platelet-rich liquid.

PRF

Forms a fibrin network that can remain liquid or become gel-like.

RELEASE PATTERN

PRP

Stronger early release in laboratory testing.

PRF

More gradual release over up to 10 days in one lab study.

WHY THAT MATTERS

The fibrin network is the biologic reason PRF is studied for gradual signaling, skin-quality support and soft client-derived gel applications. Mechanism evidence explains potential - it does not guarantee a visible result.

PRF EZ Gel under-eyes

One client's individual result. Treatment plan, timing and response vary.

THE SIGNALING PROTEINS STUDIED IN PRF

PDGF | TGF-BETA | VEGF | EGF | IGF

These factors are studied for roles in cell migration, collagen-related signaling, microvascular activity and tissue-repair processes. Their presence supports the biologic rationale; it does not guarantee a cosmetic outcome.

THE PRF FACIAL AESTHETICS GUIDE

Your skin. Your biology. Your refresh.

A highly personal approach to refreshed under-eyes, smoother-looking texture, luminous skin quality and subtle volume.

INJECTABLE PRF | PRF EZ GEL | TOPICAL PRF + NEEDLING

EVIDENCE-INFORMED | MODEL SHOWN | INDIVIDUAL OUTCOMES VARY

PRF is not one treatment. It is a personalized family of options.

BENEFITS BY CONCERN | THREE TREATMENT PATHS | FOUR RESEARCH SNAPSHOTS

The most persuasive plan is the one built around what you want to improve - and what the evidence can honestly support.

WHAT CLIENTS WANT TO SEE

The visible benefits, matched to the concern.

Brighter-looking under-eyes

May soften a tired, shadowed or crepey look and improve the appearance of fine lines. True pigment may not respond.

Smoother-looking texture

Supports a refined look to uneven texture, enlarged-looking pores and select shallow or rolling scar appearance when paired with needling.

Luminous skin quality

Chosen for gradual-looking improvement in radiance, tone, softness, elasticity and the appearance of fine lines.

Subtle temporary volume

PRF EZ Gel can add soft support in selected delicate areas without synthetic filler material. It is not a full replacement for structural filler.

WHY CLIENTS CHOOSE PRF

- Client-derived and prepared the day of treatment
- No synthetic filler material in PRF or PRF EZ Gel
- Very low allergy or rejection risk
- Gradual, natural-looking change rather than an overdone look
- Flexible: liquid, gel or topical use based on the goal

IS PRF RIGHT FOR ME?

OFTEN A GOOD FIT

Generally healthy adults seeking gradual, natural-looking refinement and willing to accept temporary swelling or bruising.

WE MAY PAUSE OR ADAPT

Active infection or breakout, certain platelet or bleeding disorders, anticoagulant use, pregnancy or breastfeeding, or keloid history for needling. Your provider confirms candidacy.

THREE TREATMENT PATHS

Same biology. Different delivery.

1 INJECTABLE PRF

Liquid PRF is placed in select facial areas by a registered nurse under medical direction. It is used for targeted skin-quality goals and delicate under-eye concerns.

BEST FIT: Crepey under-eyes, fine-line appearance, targeted refinement.

2 PRF EZ GEL

PRF is gently processed into a soft, client-derived gel. It offers immediate temporary support plus a gradual-looking skin-quality response.

BEST FIT: Subtle volume where a softer alternative to synthetic filler is preferred.

3 TOPICAL PRF + NEEDLING

Fluid PRF is applied to the skin surface during selected microneedling or microchanneling. It is topical - not injected - and does not add volume.

BEST FIT: Texture, radiance, fine lines, pore appearance and select shallow scars.

A REALISTIC TIMELINE

- | | |
|---------------------|---|
| DAY 0-3 | Temporary swelling, redness, tenderness or bruising may be most noticeable. |
| WEEKS 1-6 | Early changes may become visible progressively; the pace varies by treatment and person. |
| MONTHS AHEAD | The plan may include a short series and individualized maintenance rather than one-and-done promises. |

WHAT THE RESEARCH SAYS

Encouraging evidence. Honest interpretation.

2024 REVIEW | 96 SELECTED ARTICLES

Davies and Miron reported generally favorable outcomes across autologous platelet concentrates for texture, tone, elasticity, fine lines and wrinkles, with treatments generally well tolerated.

READ IT CORRECTLY

The review includes PRP, PRF and related concentrates; most published studies were PRP. Small samples and nonstandard protocols limit certainty.

2021 RANDOMIZED SPLIT-FACE TRIAL | N=30

Hu and colleagues compared PRFM with saline. At 6 weeks, overall objective skin-quality scores favored PRFM; texture was the only individual parameter with a significant between-group difference.

READ IT CORRECTLY

Spots, fine rhytids and pores were not proven to differ; persistence beyond 6 weeks after one treatment was inconclusive.

2016 LABORATORY RELEASE STUDY | 6 DONORS

Kobayashi and colleagues found PRP released more growth factors early, while PRF and A-PRF showed a more gradual release pattern over 10 days.

READ IT CORRECTLY

This explains biologic rationale. It was not a facial-outcome trial and cannot predict an individual's visible result.

2022 UNDER-EYE SPLIT-FACE TRIAL | N=40

Diab and colleagues studied two sessions of PRP versus plasma gel. Both improved periorbital wrinkles; the gel side performed better. Neither reduced measured pigmentation.

READ IT CORRECTLY

The plasma-gel protocol is not identical to every PRF EZ Gel system, and improvement was not maintained through the following 3 months.

THE TRUST-BUILDING BOTTOM LINE

PRF is promising, personalized and biologically compelling - but not magic. The strongest reason to choose it is a qualified provider who matches the preparation and delivery method to your anatomy, goal and tolerance for gradual change.
