

MICROCHANNEL SERUMS

Pro Microchannel Serum (Pro System) MD Microchannel Serum (MD System)

The Pro Microchannel Serum and MD Microchannel Serum share the same core formulation, with one key difference: the MD Serum contains twice the concentration of growth factors.

FULL INGREDIENT LIST

Water (Aqua), Benzyl Alcohol, Dehydroacetic Acid, Hyaluronic Acid, Silanetriol, Butylene Glycol, Phenoxyethanol, Sorbic Acid, Citric Acid, Plankton Extract, Lecithin, Arabidopsis Thaliana Extract, Micrococcus Lysate, Pentylene Glycol, 1,2-Hexanediol, Sodium Phosphate, (bFGF) sh-Polypeptide-1, (aFGF) sh-Polypeptide-11, (IGF2) sh-Polypeptide-31, (IGF1) sh-Oligopeptide-2, (FGF10) sh-Polypeptide-10, (TGF-beta3) sh-Polypeptide-5, (CG-PDGF) sh-Polypeptide-8, (KGF) sh-Polypeptide-3, (HGF) sh-Polypeptide-62, (Mini EGF) Acetyl Octapeptide-17 Amide, Polyquaternium-10

FREE FROM

This product is free from: Parabens, Sulfates, Phthalates, Synthetic Fragrance (Parfum), Artificial Dyes or Colorants, Mineral Oil, Petroleum, Formaldehyde, Hydroquinone, Steroids, Human Cells or Human Tissue, Human-Derived DNA or RNA, Silicones, Retinol, Gluten.

Cruelty-Free: Not tested on animals.

NOTES

- Contains Benzyl Alcohol (a gentle preservative) and no drying alcohols. Although Benzyl Alcohol in higher amounts can be drying, the percentage in the formulation for preservative purposes is miniscule and does not have this effect.
- Micrococcus Lysate is a bacterial-origin repair enzyme.
- Arabidopsis Thaliana Extract is a plant-derived repair enzyme.
- All “sh-” growth factors are made using recombinant technology (synthetically produced) and are not derived from human tissue.
- Hyaluronic Acid is fermentation-derived.
- Lecithin is plant-sourced.

COMMON QUESTIONS & ANSWERS

“Is this derived from human stem cells?”

No. Procell Therapies’ 2025 to current day serums use recombinant growth factors, which are produced through bioengineering which does not involve using human tissue. In earlier formulations, growth factors were collected from stem cell-conditioned media (the liquid environment in which stem cells were cultured). The 2025 reformulation eliminates that process entirely. Instead, each growth factor is individually produced using recombinant DNA technology, where the gene encoding a specific human growth factor is inserted into a host cell (typically bacterial or yeast) that manufactures the protein. The result is a growth factor that is molecularly identical to the human version, but it was never inside, derived from, or in contact with a human stem cell. No human cells, human tissue, human DNA, or human RNA are present in the final product.

“Is this vegan?”

Procell serums do not contain animal-derived ingredients. The growth factors are synthetically produced (recombinant), the Hyaluronic Acid is fermentation-derived, and the Lecithin is plant-sourced.

“Is this kosher?”

Kosher dietary laws apply to food and oral consumption. Procell serums are topical skincare products applied to the skin, not ingested. Most rabbinical authorities agree that cosmetics used externally do not need to meet kosher standards. The serums do not contain any ingredients commonly flagged under kosher restrictions (no shellfish derivatives, no pork-derived ingredients). For specific concerns related to religious observance, we recommend consulting with your rabbi or religious authority.

“Is this cruelty-free?”

Yes. Procell Therapies does not test its products on animals.

MICROCHANNEL SERUMS

“Does this contain human cells, human tissue, or human DNA?”

No. The recombinant growth factors (“sh-” peptides) are synthetically produced proteins. They are bio-identical to human growth factors in structure, but they are not derived from, harvested from, or containing any human biological material. The “sh” prefix stands for “synthetic human,” indicating a lab-produced protein. No human cells, tissue, DNA, or RNA are present.

“Is this fragrance-free?”

Procell serums do not contain synthetic fragrance or parfum.

“Is this safe during pregnancy or breastfeeding?”

There is no safety data on microchanneling treatments or topical growth factors in pregnant or breastfeeding women. While the absence of data does not mean these treatments are unsafe, the unknown is reason enough for Dr. Schwartz to advise against use during this time.

It’s also important to note that pregnancy-related hormonal changes can significantly affect the skin, including hyperpigmentation and the body’s natural repair mechanisms. Allowing your body to return to its baseline before pursuing corrective treatments will ultimately make those treatments more effective and will ultimately be a better investment.

“Is this gluten-free?”

Yes. The Microchannel Serums (Pro and MD) do not contain any gluten-containing ingredients.
